DRAFT #1

About the VTG 3

The VTG 3 was born out of the VTG 1 and the VTG 2. These were technical documents for spinning two props and were produced in pdf form. Both of these documents attempted to clarify understandings of compound circles, the types of patterns created within a given timing and direction and how to transition between them. VTG 3 synthesizes all this knowledge into an elegant and coherent system.

The Vulcan Tech Gospel Is a system designed to teach both the beginner and advance spinner. The first goal of VTG 3 is to help the user to understand the variety of flower patterns available in a given arm and prop timing and direction. The second is teach the user how to transition between patterns within a given timing and direction.

The VTG 3 is constrained to

- One pair of parallel planes
- Situations where props do not change speed individually
- Prop facings and hands start in 2 of the six snapshots, one from each axis

Happy Spinning and enjoy
Noel

Timing and Direction

Timing and direction refers to the relative timing, tog and split and the relative direction, same and opp, of two props or hands in a pattern.

The timing is always listed first and the direction second

There are four timing and directions each line lists the abbreviation first

TS - Tog/Same- Together Time Same Direction

SS- Split/ Same - Split Time Same Direction

TO - Tog/ Opp- Together Time Opposite Direction

SO - Split/ Opp- Split Time Opposite Direction

One of the largest challenges in VTG is to recognize due to the props and the arms completing the same amount of rotations the props and the arms can have a distinct timing and direction relationships. For the purposes of VTG.

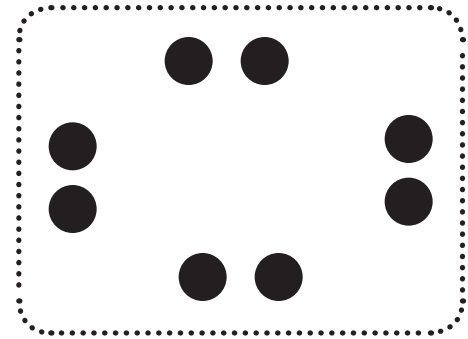

The larger circle completed by the arm is listed first of the two timing and directions. The smaller prop circle timing and direction is listed second. It may be challenging at first to recognize a tog timing when the arms are split apart from one another or vice versa.

Ex:

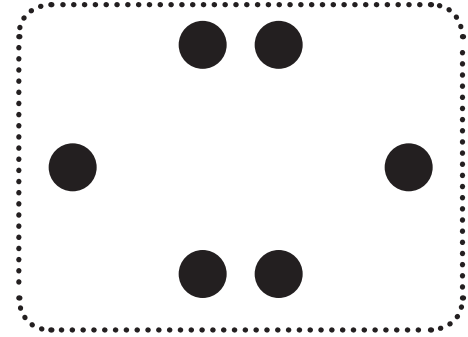

SO/ SS

Above the arms are completing split time opposite directions while the props are in split time same direction.

Snapshots

A snapshot is the image of a given pattern across the x or y axis. This includes that of both the arms on the larger circle and the props from the circle formed at the hand.

There are six snapshots in each axis making for a total of 12 snapshots.

x **y**

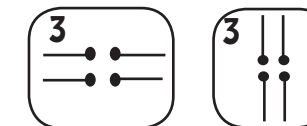

Tog out - Both props are together facing out either on the left or right or the top and bottom

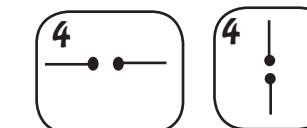

Split out - Props facing out, seperated by 180 degrees, and located on the opposite sides of the circle.

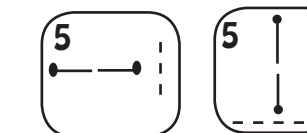

Tog in Both props are together facing in either on the left or right or the top and bottom

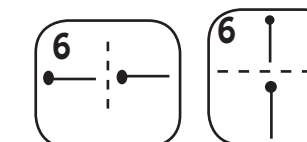

Split In Props facing in, seperated by 180 degrees, and located on the opposite sides of the circle.

Tog Split - Hands are together but the props are facing 180 degrees apart.

Split Tog- Hands are split but the props are facing the same direction

Pattern

Pattern refers to the image that the props of a given pattern create stretched out over 360 degrees. The pattern indicates how many prop rotations per arm rotations you are attempting.

The Patterns for the VTG are in

1:1

1:3

1:5

Notice on this page the patterns are arranged so that vertically in each box to show the possible transitions between timings.
